Из выше представленных графиков можно убедиться в том, что когда начинает заканчиваться обычная память, начинает использоваться swap. Программа аварийно завершалась при размере массива чуть больше 30000000, когда заканчивалась и обычная память, и swap.
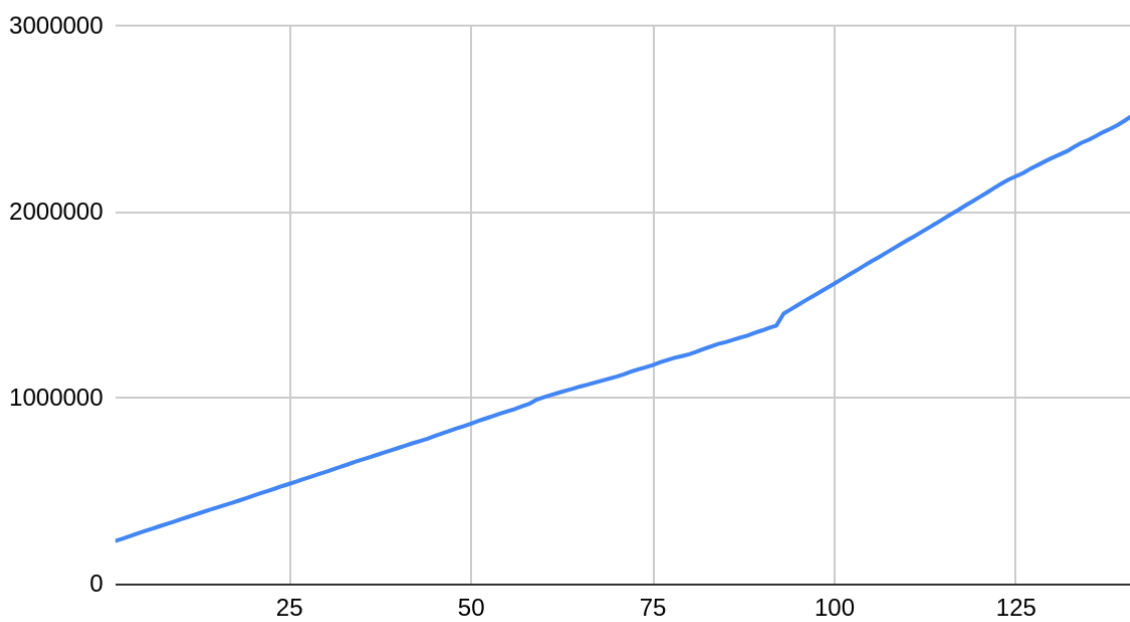

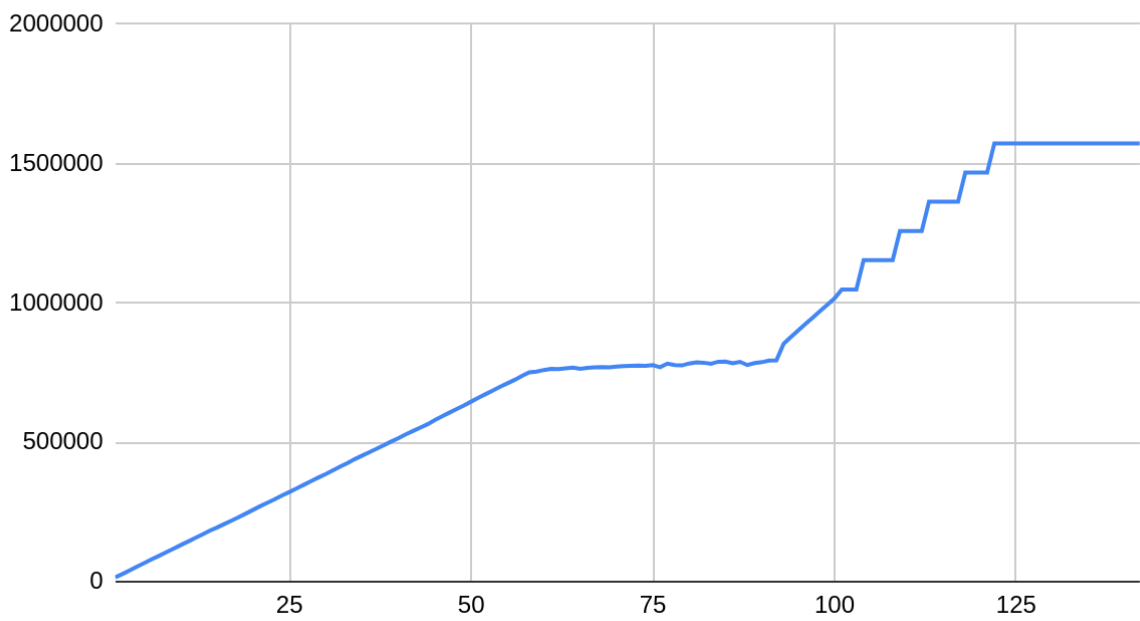

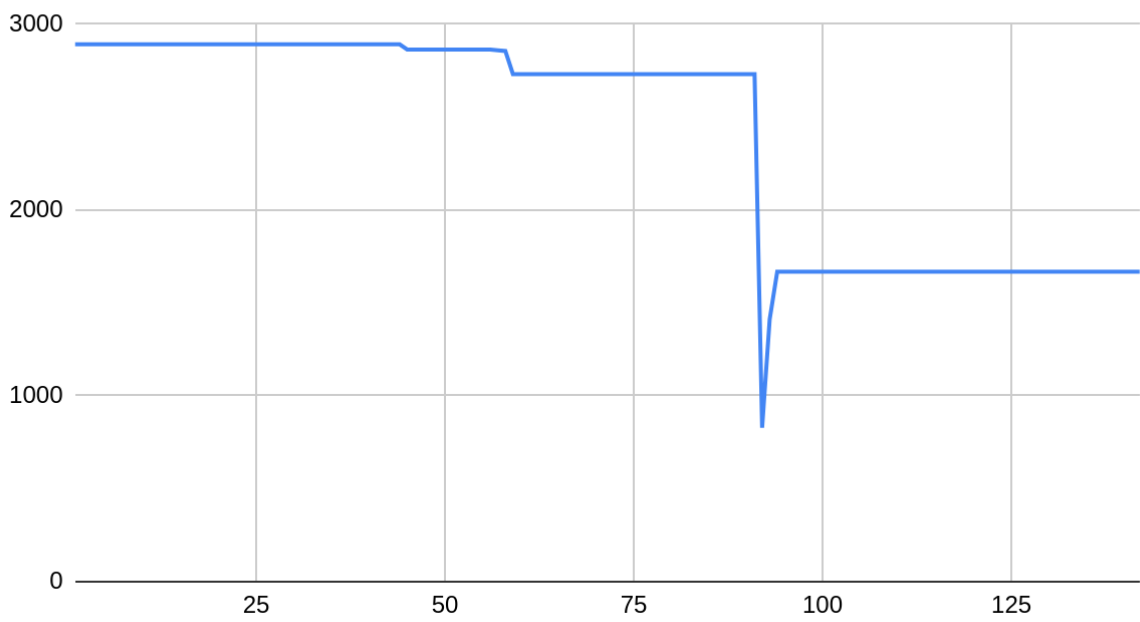

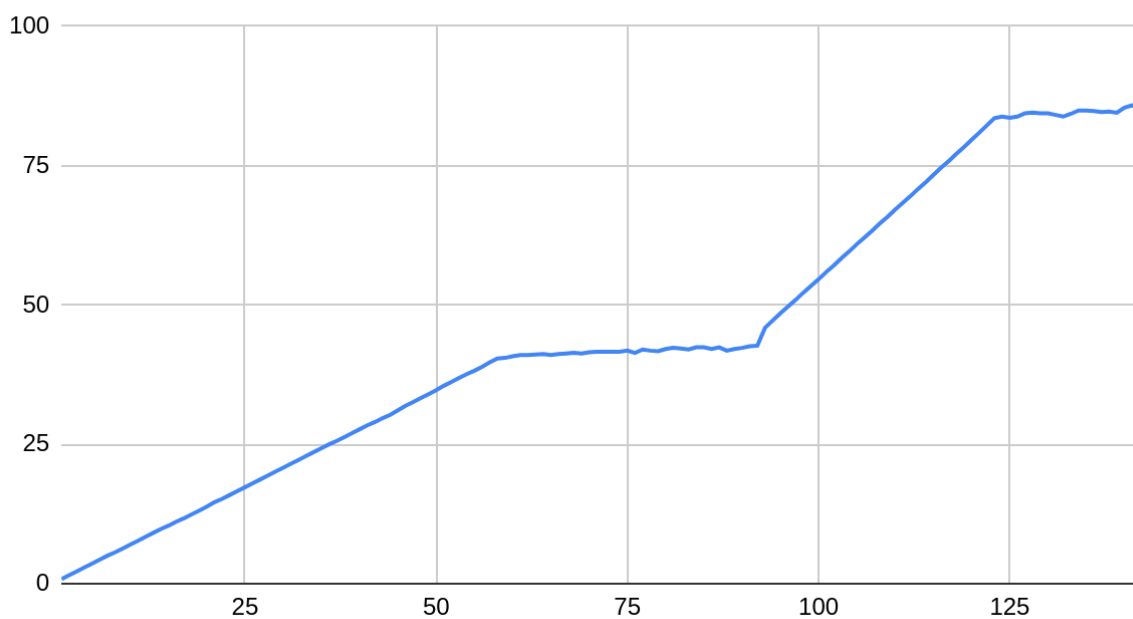

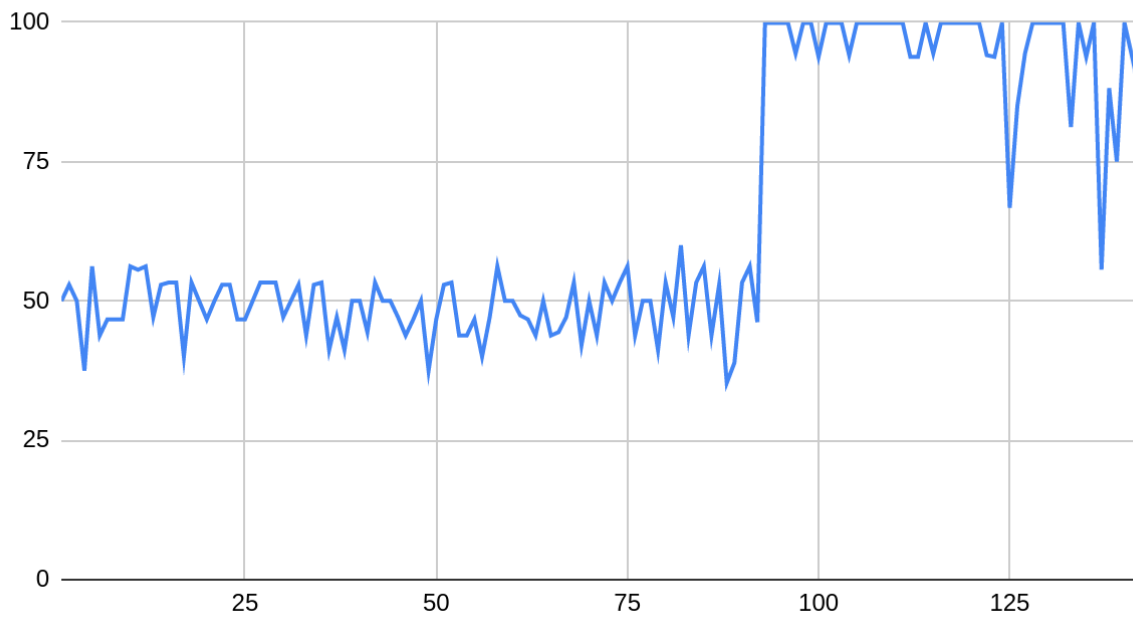

Вывод: выделение памяти работает корректно.

Эксперимент №2

При n = 3000000/10 и k=10 аварийного завершения нет
При n = 3000000/10 и k=30 произошло аварийное завершение нескольких процессов
Далее методом бин поиска я определил, что при n = 1420000 все хорошо, а при n = 1430000 происходит аварийное завершение нескольких процессов.
Из этого эксперимента можно сделать вывод, что выделение памяти работает норм
